

research practicum sprint 2 (meeting 2)

Quick recap

The team met to discuss map development options for their application, with Danila proposing to use OpenStreetMap data with Leaflet for rendering rather than Google Maps. They debated between implementing wheelchair accessibility routing through OpenRoute Services API versus redirecting to Google Maps, with concerns about demonstrating their commitment to accessibility features. Sayli agreed to test both approaches and report back by Tuesday, as she needs to present the map implementation for the upcoming sprint. The team also discussed backend deployment plans, with Danila wanting to test deployment on Render to understand the process, and Erwan mentioned populating the database with real data from Ticketmaster API. Xiya reminded the team to finalize technology decisions and business model considerations for her presentation due Thursday.

Next steps

Danila

- Continue working on the backend endpoints and start writing tests for them.
- Investigate and resolve the access issue for deploying the backend on Render.
- Provide a score from the backend endpoint for the heat map zones.
- Create the meeting outcomes and agenda for the next meeting.

Erwan

- Adjust the database schema to match the Ticketmaster API data and populate the database with real data for the heat map feature.

Kezhen

- Grant admin access to Danila for the GitHub organization to enable deployment testing.

Sayli

- Test and decide on the map stack (Leaflet/OpenStreetMap with OpenRouteService vs. redirecting to Google Maps) and implement the map on the screen by Tuesday for the presentation.
- Prioritize implementing the login and registration features using Supabase.

Xiya

- Update the mockups based on the chosen map solution and finish the pre-presentation for Tuesday, including the business model.

Summary

Front-End Development Updates Discussion

Danila discussed updates to the front-end development, including filtering capabilities by category, start time, and price. He mentioned starting work on basic functionality to call and display items. The meeting then transitioned to discussing the agenda, which included map development, though the specific details about map development were not covered in the provided transcript segment.

OpenStreetMap Implementation Discussion

The team discussed using OpenStreetMap instead of Google Maps for their project. They explored options for implementing the map functionality, including using Leaflet with OpenStreetMap data and VR Carto. For route calculations, they considered redirecting users to external services like Too Good To Go or using Open Route Services API, which allows for wheelchair-friendly directions with 2,000 daily API calls.

App Navigation and Accessibility Features

The team discussed implementing navigation features in their app, with a focus on wheelchair accessibility. While Xiya and Danila agreed that using Google Maps directly might be easier than developing their own API, Danila expressed concern about not implementing wheelchair accessibility functionality directly in their app, as this would impact their inclusion and diversity goals. The team considered both options, with Danila suggesting they could implement multiple route types (walking, cycling, car, and wheelchair) using ORS if it's feasible, while keeping the option to switch to Google Maps redirection if needed.

Mapping Integration Options Discussion

The team discussed options for mapping integration, with Danila suggesting Google Maps as a possibility while encouraging everyone to share their thoughts. Xiya proposed combining functionality by using a different API for wheelchair accessibility selection and then directing to Google Maps accordingly. Sayli agreed to test both options since the implementation would involve front-end work, and the team discussed technical aspects of integration and logging.

Render Access Setup Discussion

Danila discussed ongoing work on endpoints and requested access to Render for deployment testing, but was unable to locate the original access request. Kezhen offered to help with the Render access setup, and they agreed to work together on this later. The team also briefly mentioned that Erwan was working on business endpoints and KZ was working with the database.

Map Preparation and Endpoint Testing

Danila and Sayli discussed preparing maps for an upcoming presentation scheduled for next week. Sayli agreed to complete the map work by Tuesday. Danila also mentioned plans to start working on deployment and writing tests for the endpoints, having previously focused only on creating endpoints. Xiya suggested using Swanger UI to test endpoints without a frontend.

Sprint Planning and Progress Review

The team discussed progress on their project, with Danila mentioning the need to focus on basic functionality including login and maps for the current sprint, as the backend requirements were already beyond what was expected. Xiya offered to modify mockups based on Sayli's

decisions about the map area, and they planned to have a follow-up discussion on Tuesday. The team aimed to have a front-end ready by Friday, focusing on basic features rather than complex functionality for this sprint.

Sprint 3 Feature Implementation Planning

The team discussed implementing features for Sprint 3, agreeing to focus on core functionality rather than all features at once. Danila explained the approach for the heat map feature, which will use latitude and longitude coordinates with radius-based visualization using Leaflet, and noted that fake population data would be acceptable for this sprint. Kezhen mentioned creating a basic structure and combining API endpoints with the front-end implementation.

Supabase Authentication Implementation Discussion

The team discussed implementing login and registry functionality as the top priority, with Danila explaining that Supabase can handle authentication and password hashing automatically. Danila demonstrated how he has been creating sample data in Supabase to test filtering and events by category, suggesting others could do the same by generating 50-100 sample records. The discussion also touched on Supabase's capabilities for handling user authentication through JWT tokens, though the technical details about token decryption were not fully explained.

Ticketmaster API Integration Progress

Erwan discussed his work on integrating the Ticketmaster API to populate the database with real data, mentioning he would need to modify some tables and columns to better align with Ticketmaster's venue data structure. Xiya confirmed she would complete the pre-presentation by Tuesday and requested team input on business modes to include in the presentation, with a full upload deadline of Thursday. The team clarified that while Leaflet can be used for map rendering, the underlying data should come from OpenStreetMap, and they confirmed good progress on the project with positive feedback from stakeholders.
